The invention relates to Bcl-G polypeptides and nucleic acids encoding them. The Bcl-G polypeptides can be expressed by standard recombinant methodology. Bcl-G oligonucleotides (or its anti-sense strand) and Bcl-specific antibodies are useful for diagnosing cancer, monitoring cancer therapy or assessing prognosis of patients with cancer. The Bcl-G polypeptides are useful for modulating the activity of an oncogenic polypeptide. They are useful for identifying modulators, for modulating a level of apoptosis mediated by the Bcl-G polypeptide. A therapeutic composition comprising the Bcl-G polypeptide, polynucleotide or antibod is useful for treating a pathology characterized by abnormal cell proliferation especially cancer. The present sequence represents a CDNP
                                                                                                                                                                                                                                                                                                                                                            Claim 3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antiapoptotic;

The BCL-X-like polynucleotides are useful in therapeutic, diagnostic and pharmacogenic applications. They are useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of protein in the body and also for treating physiological disorders and diseases. The BCL-X-like polynucleotides are useful in conjunction with polymerase chain reaction to screen libraries, isolate clones, to prepare cloning and sequencing templates and as hybridisation probes for assessing gene expression patterns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Donoho G,

CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC polymerased are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as CC imaging of sites expressing (II). (I) and (II) are useful in medical CC imaging of sites expressing (II). (I) and (II) are useful in medical CC imaging of sites expressing (II). (I) and (II) are useful in treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess blodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences. AAS64197-AAS94564 represent novel human CC diagnostic coding sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed confidence of the companion of the printed confidence of the companion of the confidence of the companion of the confidence of the companion of the confidence of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences (\underline{I}) is useful as hybridisation probes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutation responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        30-MAR-2001; 2001WO-US08631.

The BCL-X-like polynucleotides are useful in therapeutic, diagnostic and pharmacogenic applications. They are useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of protein in the body and also for treating physiclogical disorders and diseases. The BCL-X-like polynucleotides are useful in conjunction with polymerase chain reaction to screen libraries, isolate clones, to prepare cloning and sequencing templates and as hybridisation probes for assessing

                  The invention relates to Bcl-G polypeptides and nucleic acids encoding them. The Bcl-G polypeptides can be expressed by standard recombinant methodology. Bcl-G oligonucleotides (or its anti-sense strand) and Bcl-G specific antibodies are useful for diagnosing cancer, monitoring cancer therapy or assessing prognosis of patients with cancer. The Bcl-G polypeptides are useful for modulating the activity of an oncogenic polypeptide. They are useful for identifying modulators, for modulating a level of apoptosis mediated by the Bcl-G polypeptide. A therapeutic composition comprising the Bcl-G polypeptide, polypeptide or antibody is useful for treating a pathology characterized by abnormal cell proliferation especially cancer. The present sequence represents a cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               UT 2583

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  specific antibodies are useful for diagnosing cancer, monitoring cancer therapy or assessing prognosis of patients with cancer. The Bcl-G polypeptides are useful for modulating the activity of an oncogenic polypeptide. They are useful for identifying modulators, for modulating a level of apoptosis mediated by the Bcl-G polypeptide. A therapeutic composition comprising the Bcl-G polypeptide, Polypucleotide or antibody is useful for treating a pathology characterized by abnormal cell proliferation especially cancer. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to Bcl-G polypeptides and nucleic acids encoding them. The Bcl-G polypeptides can be expressed by standard recombinant methodology. Bcl-G oligonucleotides (or its anti-sense strand) and Bcl-G

                                               The present invention provides the protein and coding sequences of number of human reproductive system related antigens. These can be in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a coding sequence of the invention.

The invention relates to a spatially-addressable set of single exon CC nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting CC the probes with a collection of detectably labelled nucleic acids CC derived from mRNA of human breast, and then measuring the label CC bound to each probe of the microarray. The probes are useful for CC verifying the expression of regions of genomic DNA predicted to CC determining predisposition and/or prognosing breast disease. Gene CC expression analysis is useful for assessing the toxicity of chemical CC agents on cells. The microarray of this invention presents a far greater CC diversity of probes for measuring gene expression, with far less bias CC than expressed sequence tag microarrays. The method is suitable for CC rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. CC Note: The sequence data for this pattent did not form part of the CC printed specification, but was obtained in electronic format directly cxx

                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                     Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 4; SEQ ID NO 13287; 639pp + sequence listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        09-AUG-2001

                                       probes which are derived from genomic sequences expressed in the human brain. They can be used to measure genomic set pression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the

They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printe specification, but was obtained in electronic format directly from WIPC specification, but was obtained in electronic format directly from WIPC

The probes are useful for producing a microarray for predicting, measuring and displaying goexpression in samples derived from human placenta. The probes are for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Penn

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                al number of hits satisfying chosen parameters:
        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
